Plume Project Preferences - 1

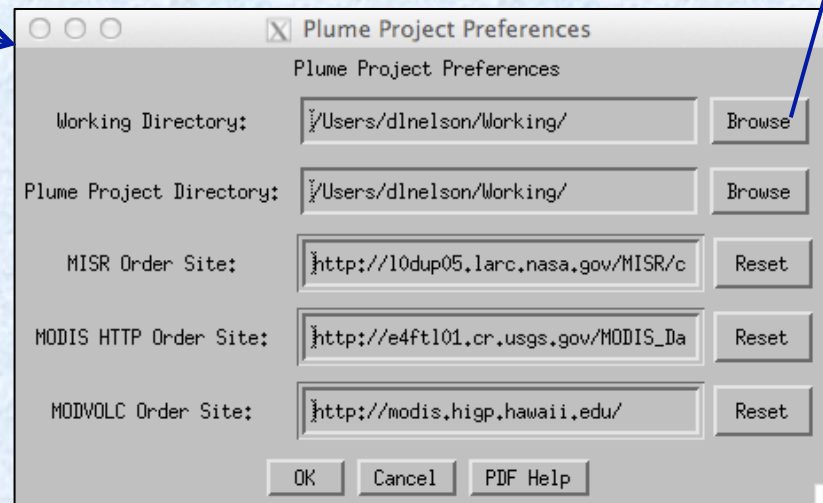

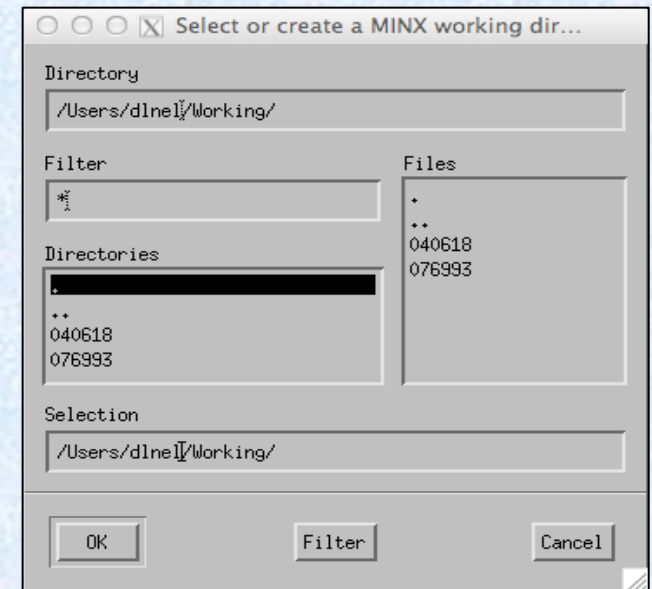

- MINX maintains a file in your home directory named MINX_preferences.sav, which saves many directory locations and other parameters between MINX sessions.
- The first time you start MINX, or on startup after deleting the MINX_preferences.sav file, you will be presented with a dialog box that prompts you to select or create a Working directory for the session. The default working directory is /<your home directory>/Working.
- The Working directory is where many MINX tools will write output. Exceptions are when MINX specifically asks you to enter an output directory.
- On successive startups, you will not see the Working directory dialog, because the Working directory name, along with many other parameters, will have been saved in a newly created MINX_preferences.sav file. Your actions during a MINX session will update certain other parameters in this file.

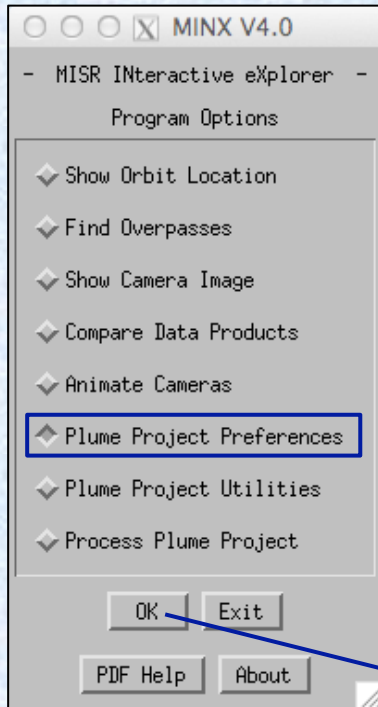

Plume Project Preferences - 2

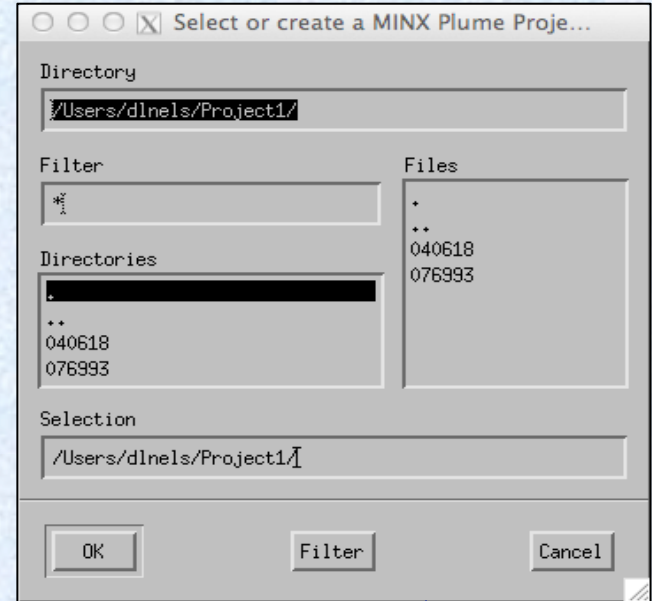

- You can change the Working directory at any time from the Plume Project Preferences option on the MINX Program Options menu.
- Click the Browse button next to Working Directory to bring up the same dialog box that was presented on initial startup.

Plume Project Preferences - 3

- Other items in the Preferences dialog refer only to the last two Plume Project items on the MINX Program Options menu.
- The Plume Project Directory plays a special role. It points to a directory that must contain a file named PlumeProjOrbitList.txt
- The PlumeProjOrbitList file in turn has entries that point to input and output directories, so you can maintain multiple projects.

This directory is important for plume projects and serves only to point to a directory that contains a PlumeProjOrbitList.txt file.

If these important website URLs ever change, you can update them here.
